

Setting Up Our Linux Lab>/

*Actually setting up Linux is a big step, that is why we are just going to use a **temporary** set up that takes less than a minute.*

If you want something that you can set up IMMEDIATELY, *but changes are temporary*, use this site (If you are on a Chromebook, use this one):

<https://distrosea.com/select/ubuntu>

If on the other hand you want something that gives you the **full feel of a Linux computer**, we can set up a “**Virtual Machine**”. Online computer effectively

“Windows Hosts” for Windows Machines, Mac Intel for Mac,

VirtualBox Platform Packages

VirtualBox 7.2.4 platform packages

Windows hosts

macOS / Intel hosts

macOS / Apple Silicon hosts

Linux distributions

Solaris hosts

Solaris 11 IPS hosts

Platform packages are released under the terms of the [GPL version 3](#)

- Click **next** for all of the options during the install.
 - After you finish the install, we want to install something else. This link below provides the download for what our “Virtual Machine” will run, which is just Linux.

<https://ubuntu.com/download/desktop>

Ubuntu 24.04.3 LTS

The latest LTS version of Ubuntu, for desktop PCs and laptops. LTS stands for long-term support — which means five years of free security and maintenance updates, extended up to 15 years with [Ubuntu Pro](#).

Intel or AMD 64-bit architecture

[Download](#)

5.9GB

For other versions of Ubuntu Desktop including torrents, the network installer, a list of local mirrors and past releases [check out our alternative downloads](#).

[What's new](#)

[System requirements](#)

[How to install](#)

☑ New Desktop installer with support for autoinstall

Now for the machine setup. Launch the *VirtualBox* application.

- It should look something like this:

Let us click *new* on the top left.

- For the *First* box, put any name. The second box leave it.
- For the third box, Grab the file path from your download folder of our latest download

- *Lastly*, add a password, click finish (the other 2 boxes are to let your machine be more powerful if need be)

Now it should launch, if not right click the Name of your machine on the left and click *“Launch”*

From here it should take care of everything itself, *this will take a while but by the end we’ll have our Lab set up and ready.*

It will look like this:

That is all we need to create our testing lab, *we can now move on to beginning to use the **Terminal**.*
