

SQL Setup

SQL is a **standard** “coding language” used to get the specific information you want from a **large pool of data** that you **CAN’T** just find *through scrolling through it all*.

We’ll need to **install** the **SERVER** that the SQL runs on, **THEN** the *actual app* that we write our code in.

- <https://www.microsoft.com/en-ca/download/details.aspx?id=101064>

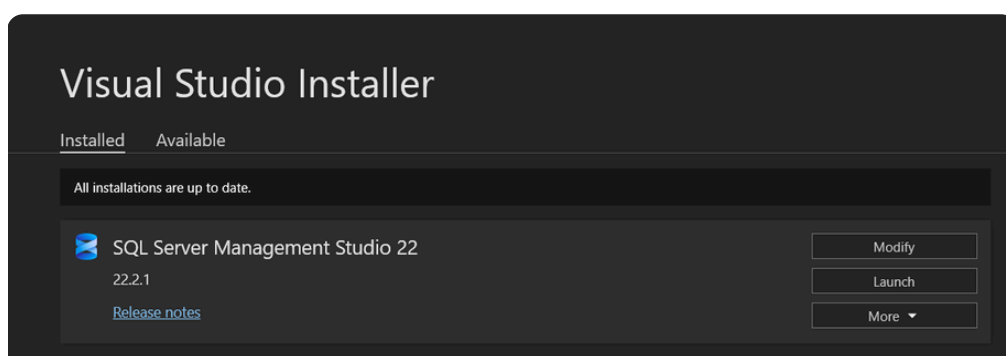

> Choose Basic, Accept the EULA & Install

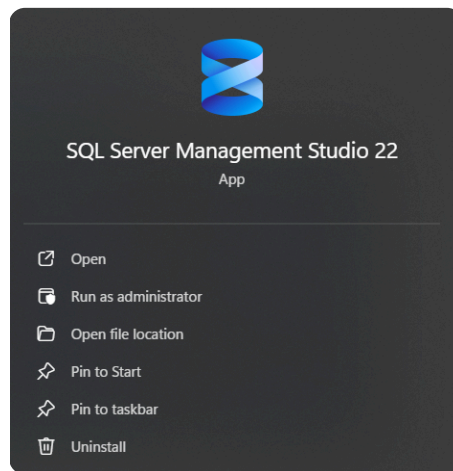

> Now, install the place we run it on

- 🌐 Install SQL Server Management Studio

You’ll see this, *but it’ll say install*.

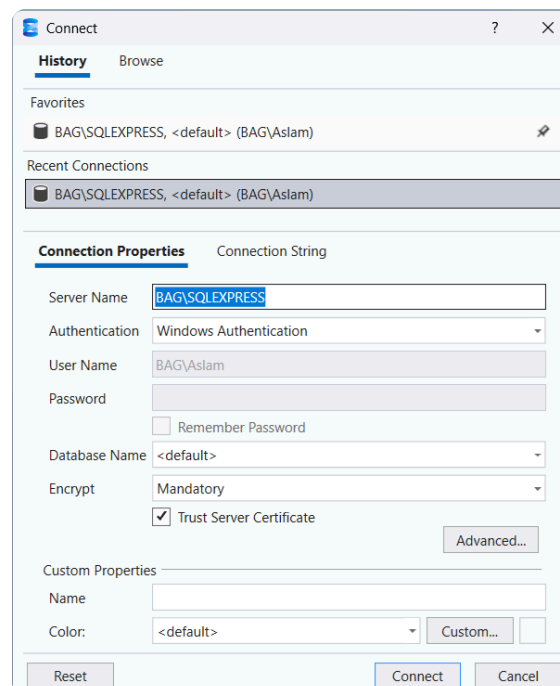

Now, let's go **onto the app**. PLEASE, run as administrator *for now*.

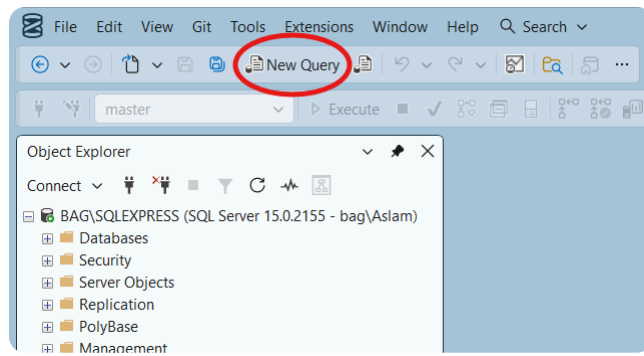

Let's attach the server.

Once you launch the app, you're met with *this box below*

- On the top go to *Browse > Local*, Click on the **option shown there**.
- **Back** in the box, at the bottom where you see "Encrypt", check mandatory
 - Click Connect.

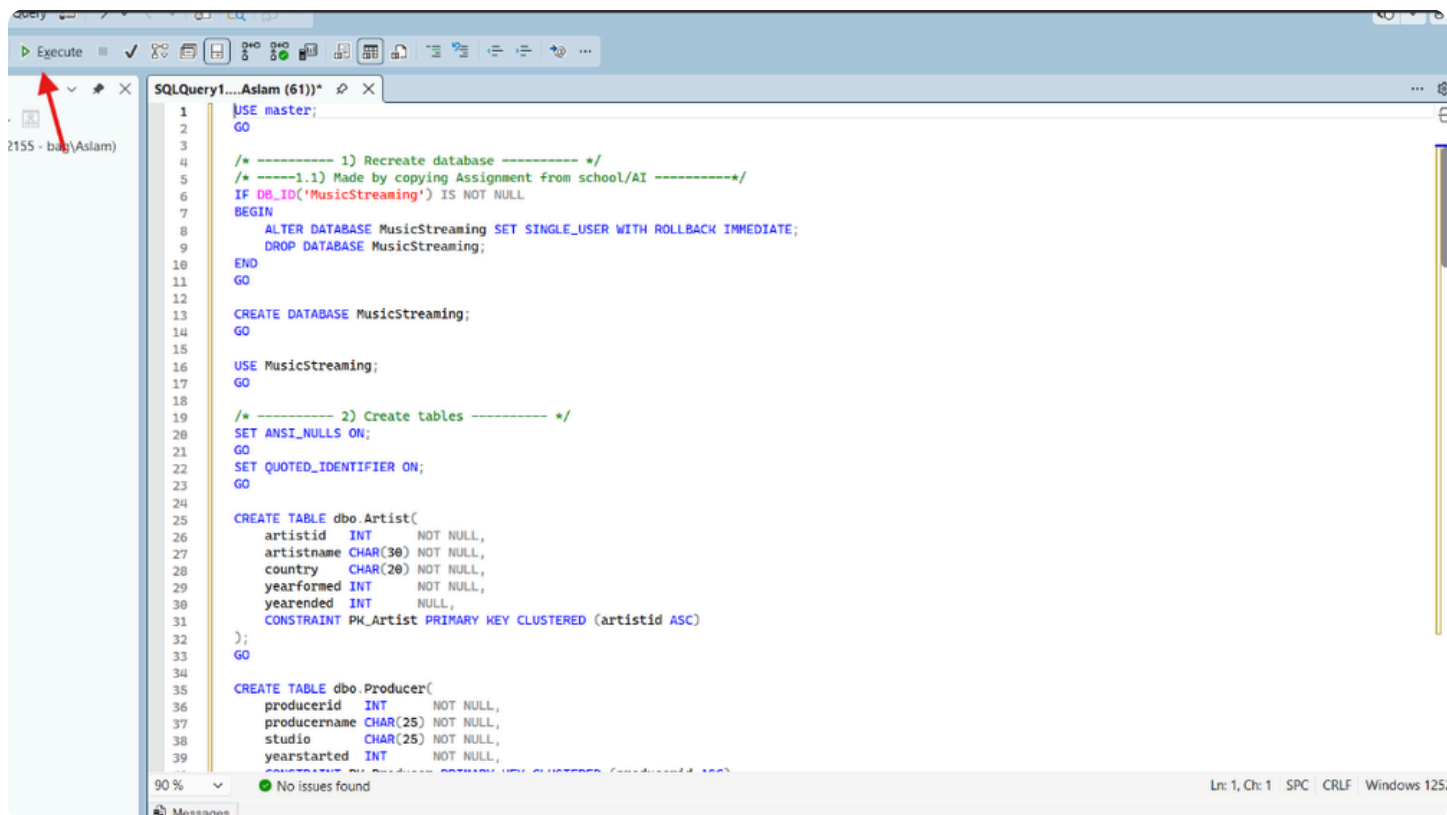

Now that were in, we need to **MAKE a database**, we can do this via a query.

- This link is to a **SQL script** to make a *database*.
 - [SQL Script - Pastebin.com](#)

In the **new query** we *just made*, paste it in here.

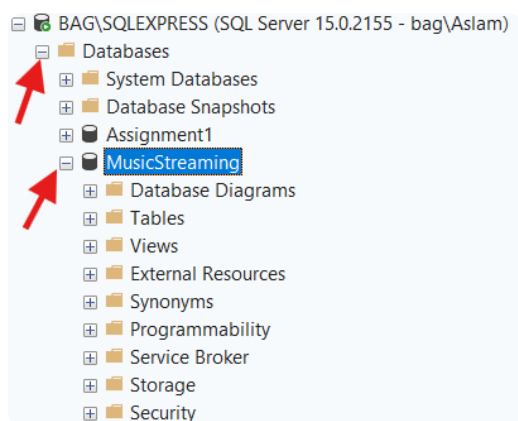

- Click **execute**

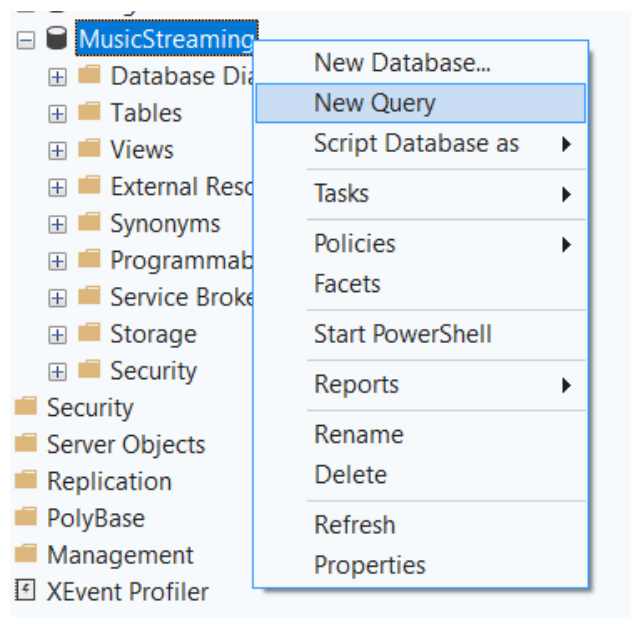

```
1  USE master;
2  GO
3
4  /* ----- 1) Recreate database ----- */
5  /* -----1.1) Made by copying Assignment from school/AI -----*/
6  IF DB_ID('MusicStreaming') IS NOT NULL
7  BEGIN
8      ALTER DATABASE MusicStreaming SET SINGLE_USER WITH ROLLBACK IMMEDIATE;
9      DROP DATABASE MusicStreaming;
10  END
11  GO
12
13  CREATE DATABASE MusicStreaming;
14  GO
15
16  USE MusicStreaming;
17  GO
18
19  /* ----- 2) Create tables ----- */
20  SET ANSI_NULLS ON;
21  GO
22  SET QUOTED_IDENTIFIER ON;
23  GO
24
25  CREATE TABLE dbo.Artist(
26      artistid INT NOT NULL,
27      artistname CHAR(30) NOT NULL,
28      country CHAR(20) NOT NULL,
29      yearformed INT NOT NULL,
30      yearended INT NULL,
31      CONSTRAINT PK_Artist PRIMARY KEY CLUSTERED (artistid ASC)
32  );
33  GO
34
35  CREATE TABLE dbo.Producer(
36      producerid INT NOT NULL,
37      producername CHAR(25) NOT NULL,
38      studio CHAR(25) NOT NULL,
39      yearstarted INT NOT NULL,
40      CONSTRAINT PK_Producer PRIMARY KEY CLUSTERED (producerid ASC)
41  );
42  GO
```

Now we have to **restart**, so we *can see* the database.

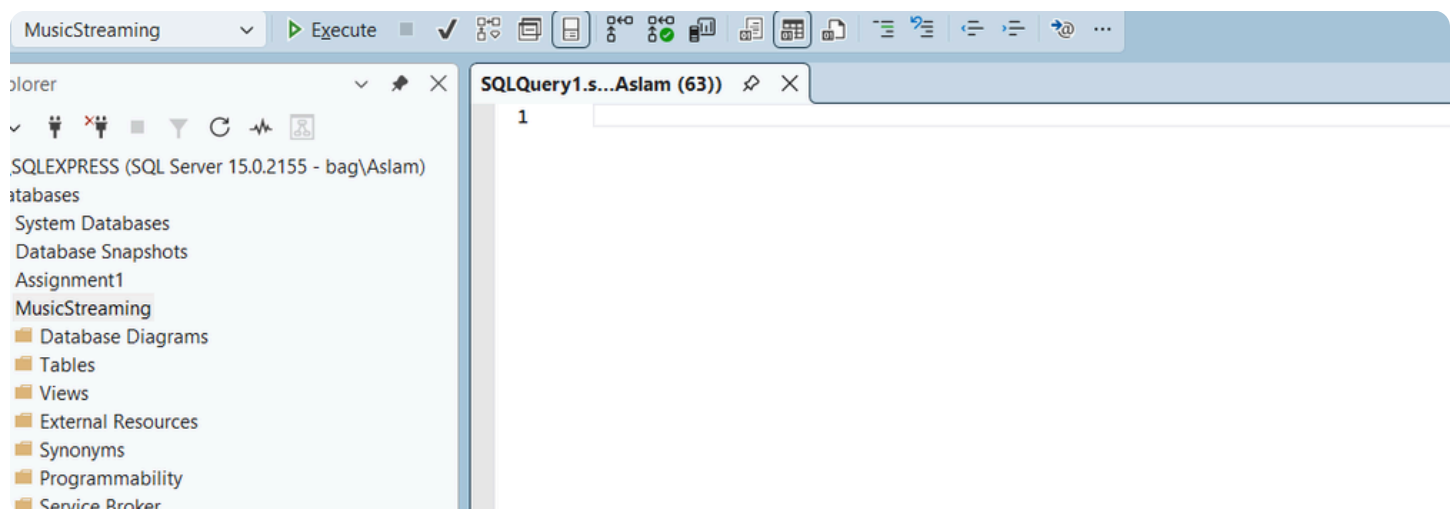

- Now we can **OPEN** the database.

Now, let's make a query; We'll *start doing queries* in the next part.

Now, in the top left *you can see our query* is in the MusicStreaming database.

In the next part we'll actually start doing queries.

*We'll learn the basic SELECT with **Relational Operators**, **Logical Operators** and **Matching**.*
