

Starting Python - Setup

A lot of people want to START programming, just as an essential life skill or just for *fun personal projects*, and Python is generally one of the easier coding languages.

The first part of the lab will go over how to setup a place to code Python.

- Please go to part 2, if you already have it ready.

Go to <https://www.python.org/downloads/>, SCROLL DOWN;

- Choose, Python 3.14.4; follow the steps (*click next or continue*)

Looking for a specific release?
Python releases by version number:

Release version	Release date		Click for more
Python 3.14.4	April 7, 2026	 Download	Release notes

After that's finished downloading, we need a PLACE to edit that code; this install above is just so it can know a file is a python file is, and how to read it.

VS-CODE; is the most common place to do code editing, since it can do more than just one language; *has customization and community add-ons*.

- <https://code.visualstudio.com/download>, Choose your OS
- If you're on Linux, another Linux Lab covers general downloading.

The screenshot shows the Python.org download page with three main sections: Windows, Linux, and Mac. Each section has a download button and a list of available installers and their architectures.

OS	Installer Type	Architecture
Windows	User Installer	x64, Arm64
	System Installer	x64, Arm64
	.zip	x64, Arm64
	CLI	x64, Arm64
	Windows 10, 11	
Linux	.deb	x64, Arm32, Arm64
	.rpm	x64, Arm32, Arm64
	.tar.gz	x64, Arm32, Arm64
	Snap	Snap Store
	CLI	x64, Arm32, Arm64
	Debian, Ubuntu	
	Red Hat, Fedora, SUSE	
	CLI	x64, Arm32, Arm64
	CLI	x64, Arm32, Arm64
	CLI	x64, Arm32, Arm64
Mac	.dmg	Intel chip, Apple silicon, Universal
	CLI	Intel chip, Apple silicon
	macOS 12.0+	

Open VS-CODE, it will look *SOMETHING* like this.

Click this on the left;

- This is the EXTENSIONS page, *we want to use this to install VS-CODE's python extensions*
- Search "Python", Install

Go back to the **PAGE** icon, *let's make a file;*

Make a new folder somewhere in your system, and select it.

Now; on the top left; there's a NEW FILE button.

- Call it; "Example.py"

Next part of the lab *will cover actual coding* (Printing, Inputs & Math); I will be skipping a lot of the fluff, so it may feel quite fast.
