

Formatting & Conventions

Alright, Let's actually go ahead and clean up our page a little bit; make the colors nicer, then add some nice styling.

- **First**, the colors |

Add this to the **title** class

```
background-color: #aaaaaa;
```

```
color: #212121;
```

Add this to the **table of contents** class

```
background-color: #c9c9c9;
```

```
color: #292929;
```

Add this to the **content** class

```
background-color: #e4e4e4;
```

```
color: #292929;
```

Add this to the **bubble style** class

```
background-color: #2b3445;
```

```
color: white;
```

Add this to the **notification** class

```
background-color: #4f5674;
```

```
color: white;
```

As well as that, let's fix the **white spaces** on the edges.

- So, we can do that by actually making our content use the **standard page format**.

First we add `<!DOCTYPE html>` at **the start**. This TELLS the page this is HTML

Then we add, `<html lang="en"> </html>` **AROUND** our content.

- **Then**, inside the HTML element; we add our elements. HEAD & BODY →

Head, holds our **TITLE**, and **LINK elements** (Like *CSS*, or **FONT IMPORTS**)

Body, holds our **DIVISIONS**

```

<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="UTF-8">
    <title>My Page</title>
    <link rel="stylesheet" href="styles.css">
  </head>
  <body>
    <!--OUR DIVISIONS, WITH OUR CONTENT-->
  </body>
</html>

```

So, we put the **INDICATOR**; of the document type

- Then we put all of our code in HTML **element**

Then, we add the **HEAD** element; inside that we put all of our information that isn't actually seen on the page.

- **INSIDE THE HEAD ELEMENT**: The **TITLE** of the page, the **LINK** for the spreadsheet, then telling it this is a UTF-8 page; which allows emojis.

Then, we added the **BODY** element; inside that we put what we have already; our **DIVISIONS**.

```

<body>
  <div class="skeleton">
    <div class="bubble">
      <button class="bubble-style">Help</button>
      <div class="notification">
        <div class="notification-number">3</div>
      </div>
    </div>
    <div class="title"> Something
  </div>
    <div class="table-of-contents"> Hi
  </div>
    <div class="content"> Hiwda
  </div>
</body>

```

```
body {  
  margin: 0;  
  padding: 0;  
}
```

So, this **CLASS**; doesn't use the `.` That is BECAUSE, we are addressing the element BODY directly, not a class.

- We are changing the elements **MARGIN & PADDING**, and setting them to 0.

MARGIN is the **white space** around something

PADDING is like **increasing the size on an element**, from the inside.

Something

Hi

Hiwda

So, the page is still EMPTY, so the next lab will cover **MAKING CONTENT**.
